

## Homework 2

In problems 3. - 5., references such as III.2.7 refer to Problem 7 in Section 2 of Chapter III in Conway's book.

If you use results from books including Conway's, please be explicit about what results you are using.

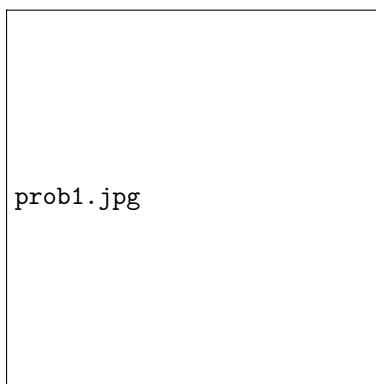

*Homework 2 is due on ICON by Midnight, February 11.*

### 1. Problem IV.1.5

**Sol.** By Proposition 1.3,

$$\begin{aligned} V(\gamma) &= \int_0^1 |\gamma'(t)| dt = \int_0^1 \left| \frac{1-i}{t^2} e^{\frac{-1+i}{t}} \right| dt = \int_0^1 \left| \frac{1-i}{t^2} e^{-\frac{1}{t}} \left( \cos \frac{1}{t} + i \sin \frac{1}{t} \right) \right| dt \\ &= \int_0^1 \frac{e^{-\frac{1}{t}}}{t^2} \sqrt{\left( \cos \frac{1}{t} + \sin \frac{1}{t} \right)^2 + \left( \sin \frac{1}{t} - \cos \frac{1}{t} \right)^2} dt = \int_0^1 \sqrt{2} \frac{e^{-\frac{1}{t}}}{t^2} dt \\ &= \sqrt{2} e^{-\frac{1}{t}} \Big|_0^1 = \sqrt{2} e^{-1}. \end{aligned}$$

Hence  $\gamma$  is rectifiable. The trace looks like the graph below:

### 2. Problem IV.1.9

**Sol.**

$$\int_{\gamma} \frac{1}{z} dz = \int_0^{2\pi} e^{-int} i n e^{int} dt = 2\pi i n.$$

### 3. Problem IV.1.12

**Sol.**

$$I(r) = \int_{\gamma} \frac{e^{iz}}{z} dz = \int_0^{2\pi} \frac{e^{ire^{it}}}{re^{it}} i r e^{it} dt = \int_0^{2\pi} i e^{ire^{it}} dt = \int_0^{2\pi} i e^{-r \sin t} (\cos(r \cos t) + i \sin(r \cos t)) dt.$$

Then

$$|I(r)| \leq \int_0^{2\pi} |i e^{-r \sin t} (\cos(r \cos t) + i \sin(r \cos t))| dt = \int_0^{2\pi} e^{-r \sin t} dt = \int_0^{\pi} + \int_{\pi}^{2\pi} e^{-r \sin t} dt.$$

Pick an arbitrary  $\epsilon > 0$ , the first term

$$\int_0^{\pi} e^{-r \sin t} dt = \int_0^{\epsilon} + \int_{\epsilon}^{\pi-\epsilon} + \int_{\pi-\epsilon}^{\pi} e^{-r \sin t} dt \leq 2\epsilon + (\pi - 2\epsilon) e^{-r \sin \epsilon}.$$

Then when  $r \rightarrow \infty$ ,

$$\int_0^\pi e^{-r \sin t} dt \leq 2\epsilon.$$

By the arbitrariness of  $\epsilon$ ,  $\int_0^\pi e^{-r \sin t} dt \rightarrow 0$  when  $r \rightarrow \infty$ . It is the same for the second term  $\int_\pi^{2\pi}$ . Hence  $\lim_{r \rightarrow \infty} I(r) = 0$ .

4. Problem IV.1.13

**Sol (a).**

$$\int_\gamma z^{-\frac{1}{2}} dz = \int_0^\pi e^{-\frac{1}{2}it} i e^{it} dt = 2e^{\frac{1}{2}it} \Big|_0^\pi = 2i - 2.$$

**(b).**

$$\int_\gamma z^{-\frac{1}{2}} dz = \int_{2\pi}^\pi e^{-\frac{1}{2}it} i e^{it} dt = 2e^{\frac{1}{2}it} \Big|_{2\pi}^\pi = 2i + 2.$$

5. Problem IV.1.14

**Proof.** First, assume  $\varphi$  is one-one. Then if  $\varphi$  is not strictly increasing, suppose there exists  $x < y \in [a, b]$ , s.t.  $\varphi(x) \geq \varphi(y)$ . If  $\varphi(x) = \varphi(y)$ , it contradicts with that  $\varphi$  is one-one. So  $\varphi(x) > \varphi(y)$ . Since  $\varphi(x) > c$  (otherwise  $\varphi(y) < c$  contradicts with  $\varphi([a, b]) \geq c$ ), by continuity of  $\varphi$ ,  $\exists z \in [a, x]$ , s.t.  $\varphi(z) = \varphi(y)$ , which makes a contradiction. Thus  $\varphi$  is strictly increasing.

Now assume  $\varphi$  is strictly increasing, then  $\varphi$  is an injection. Besides, for each  $y \in [c, d]$ , by continuity of  $\varphi$ , there is a  $x \in [a, b]$ , s.t.  $\varphi(x) = y$ . Hence  $\varphi$  is a bijection.

6. Problem IV.1.20

**Sol.**

$$\int_\gamma \frac{1}{z^2 - 1} dz = \int_0^{2\pi} \frac{1}{(e^{it} + 1)^2 - 1} i e^{it} dt = \int_0^{2\pi} \frac{i}{2 + e^{it}} dt = \frac{1}{2} i (t + i \ln(2 + e^{it})) \Big|_0^{2\pi} = \pi i$$

7. Problem IV.2.1

**Proof.** We need to show that  $g$  is continuous at each  $t_0 \in [c, d]$ . In fact,  $\forall \epsilon > 0$ , since  $\varphi$  is continuous,  $\exists \delta > 0$ , when  $|t_1 - t_0| < \delta$ , we have  $|\varphi(s, t_1) - \varphi(s, t_0)| < \frac{\epsilon}{b-a}$ . Thus when  $|t_1 - t_0| < \delta$ ,

$$|g(t_1) - g(t_0)| \leq \int_a^b |\varphi(s, t_1) - \varphi(s, t_0)| ds < \int_a^b \frac{\epsilon}{b-a} ds = \epsilon.$$

Hence  $g$  is continuous at  $t_0$ .

8. Problem IV.2.2 (Please note. This problem will be used a number of places in the theory we will develop.)

**Proof.**

9. Problem IV.2.3
