Problem 1.

Simulate the random variable X and Y, and estimate E(X) and E(XY).

Proof. 1 Answer

1. Randomly choose x_0 and y_0 , which obey $U(0, B)$;
2. For i in $1:n$,
 - 2.1 Sample x_{i+1} from $f(x|y = y_i) = C(y_i)e^{-y_i x}$;
 - 2.2 Sample y_{i+1} from $f(y|x = x_{i+1}) = C(x_{i+1})e^{-x_{i+1} y}$;
3. Choose the last $\frac{n}{2}$ samples as a simulation of X and Y;
4. $E(X) = \frac{2}{n}\sum x_i$, for x in the samples mentioned above; $E(XY) = \frac{4}{n^2}\sum_i \sum_j x_i y_j$, for x and y in the samples in step 3; □

Problem 2.

Estimate (1) $E(X_1 + 2X_2 + 3X_3|X_1 + 2X_2 + 3X_3 > 15)$, (2) $E(X_1 + 2X_2 + 3X_3|X_1 + 2X_2 + 3X_3 < 1)$ with simulation methods.

Proof. 2 Answer

2.1 subproblem1

□

Problem 3.

Estimate X, Y, Z and E(XYZ) with the distribution given.

Proof. 3 Answer

3.1 subproblem1

1. We have $f(x|y, z) = \frac{f(x, y, z)}{\int_0^\infty f(x, y, z) dx} = (ay + bz + 1)e^{-(x+axy+bzx)}$.
Equally, $f(y|x, z) = (ax + cz + 1)e^{-(y+axy+cyz)}$, $f(z|x, y) = (bx + cy + 1)e^{-(z+bxz+cyz)}$.
2. Randomly select the initial data x_0, y_0, z_0 , which are all larger than 0.
3. For i in $0:n$,
 - 3.1 Sample x_{i+1} from $f(x|y_i, z_i) = (ay_i + bz_i + 1)e^{-(1+ay_i+bz_i)x}$;
 - 3.2 Sample y_{i+1} from $f(y|x_{i+1}, z_i) = (ax_{i+1} + cz_i + 1)e^{-(1+ax_{i+1}+cz_i)y}$;
 - 3.3 Sample z_{i+1} from $f(z|x_{i+1}, y_{i+1}) = (bx_{i+1} + cy_{i+1} + 1)e^{-(1+bx_{i+1}+cy_{i+1})z}$;
4. Choose the last half as an estimation of X, Y and Z.

3.2 subproblem2

1. Sample X, Y, Z with the process above, in which a, b, c replaced by 1;
2. Estimate $E(XYZ) = \frac{8}{n^3} \sum \sum \sum xyz$, in which x, y, z are the samples chosen.

3.3 the code of subproblem2 is as follows.

```
1 ##### Gibbs Sampling for problem 3 #####
2 sample3 = function(param1, param2) {
3   lambda = 1/(param1 + param2 + 1);
4   ##### Using inverse transform algorithm to generate the distribution:
5   ##### f(x|lambda) = lambda*exp(-lambda*x);
6   u = runif(1);
7   x = -lambda*log(lambda*u);
8   return(x);
9 }
10
11 gibbs_sampling3 = function(n, init_param) {
12   ##### Initialize parameters;
13   x = rep(0, n);
14   y = rep(0, n);
15   z = rep(0, n);
16   x[1] = init_param[1];
17   y[1] = init_param[2];
18   z[1] = init_param[3];
19
20   ##### Iterative Sampling;
21   for(i in 2:n) {
22     x[i] = sample3(y[i-1], z[i-1]);
23     y[i] = sample3(x[i], z[i-1]);
24     z[i] = sample3(x[i], y[i]);
25   }
26   rlist = list(x, y, z);
27   return(rlist);
28 }
29
30 estimate3 = function(n) {
31   res = gibbs_sampling3(2*n, c(1, 1, 1));
32   X = res[[1]];
33   Y = res[[2]];
34   Z = res[[3]];
35   X_sample = X[(n+1):(2*n)];
36   Y_sample = Y[(n+1):(2*n)];
37   Z_sample = Z[(n+1):(2*n)];
38
39   sum = sum(X_sample)*sum(Y_sample)*sum(Z_sample);
40   return(sum/(n^3));
41 }
42
43 estimate3(100000)
```

3.4 the result of subproblem2 is as follows

```
1 > estimate3(100000)
2 [1] 0.4532435
```

□

Problem 4.

Estimate $E(X)$, $E(Y)$ and $E(N)$ with the distribution given.

Proof.

□

Problem 5.

Generate a mixed normal distribution with the means and covariances given.

Proof. 4 Answer**4.1 the algorithm**

1. Randomly select the initial vector X and Y .
2. For each step:
 - 2.1 Generate X_{i+1}, Y_{i+1} with X_i, Y_i using Gibbs Sampling.
 - 2.2 Generate $u \sim U(0, 1)$, if $u > 0.5$, set $Z = X$; else $Z = Y$.
3. In detail, in order to generate a 2D normal distribution, we can regard the joint distribution as

$$f(x_1, x_2) = \frac{1}{2\pi\sqrt{\det \Sigma}} e^{\frac{1}{2}(a_{11}(x_1 - \mu_1)^2 + (a_{21} + a_{12})(x_1 - \mu_1)(x_2 - \mu_2) + a_{22}(x_2 - \mu_2)^2)},$$

in which a_{ij} are the elements in Σ , and μ_i are the elements in μ .

$$3.1 \quad f(x_2|x_1 = \hat{x}_1) = N(\mu_2 + a_{21}a_{11}^{-1}(\hat{x}_1 - \mu_1), \quad a_{22} - a_{21}a_{11}^{-1}a_{12}),$$

$$f(x_1|x_2 = \hat{x}_2) = N(\mu_1 + a_{12}a_{22}^{-1}(\hat{x}_2 - \mu_2), \quad a_{11} - a_{21}a_{22}^{-1}a_{12}).$$

3.2 Use Gibbs sampling to generate iteratively X and Y .

4.2 the code is as follows

```

1 ##### Gibbs Sampling for Problem 5 #####
2 sample5 = function(mu, sigma, x) {
3   mean = mu[2] + sigma[2, 1] * (1/sigma[1, 1]) * (x - mu[1]);
4   sd = sigma[2, 2] - sigma[2, 1] * (1/sigma[1, 1]) * sigma[1, 2];
5   return(rnorm(1, mean, sd));
6 }
7
8 gibbs_sampling5 = function(n, mu, sigma, init_param) {
9   x1 = rep(0, n);
10  x2 = rep(0, n);
11  x1[1] = init_param[1];
12  x2[1] = init_param[2];
13
14  mu2 = c(mu[2], mu[1]);
15  sigma2 = matrix(c(sigma[2, 2], sigma[2, 1], sigma[1, 2], sigma[1, 1]), ncol = 2);
16
17  for(i in 2:n) {
18    x2[i] = sample5(mu, sigma, x1[i - 1]);
19    x1[i] = sample5(mu2, sigma2, x2[i]);
20  }
21  rlist = list(x1, x2);
22  return(rlist);
23 }
24
25 simulate5 = function(n) {

```

```

26 mu1 = c(1, 4);
27 mu2 = c(-2, -1);
28 sigma1 = matrix(c(1, 0.3, 0.3, 2), ncol = 2);
29 sigma2 = matrix(c(3, 0.4, 0.4, 1), ncol = 2);
30
31 Z = matrix(rep(0, 2*n), nrow = 2);
32 ##### Each col in Z is a sample point #####
33
34 X = gibbs_sampling5(2*n, mu1, sigma1, c(1, 1));
35 Y = gibbs_sampling5(2*n, mu2, sigma2, c(-3, -3));
36
37 x1 = X[[1]];
38 x2 = X[[2]];
39 y1 = Y[[1]];
40 y2 = Y[[2]];
41
42 ##### Take the last half of samples as a simulation ###
43 for(i in 1:n) {
44   u = runif(1);
45   if(u > 0.5) {
46     Z[1, i] = x1[i + n];
47     Z[2, i] = x2[i + n];
48   }
49   else {
50     Z[1, i] = y1[i + n];
51     Z[2, i] = y2[i + n];
52   }
53 }
54 return(Z);
55 }
56
57 n = 10000
58 z = simulate5(n)
59 plot(z[1, ], z[2, ])

```

4.2.1 The result is shown as follows

□

Figure 1: The simulation of the mixed distribution
