Problem 1.

Display The Runge Phenomenon.

Proof. 0.1 The code is shown as follows.

```
1 function [ value ] = newton_coefficient( given_points , function_values )
2 n = length( function_values );
3 for i = 1: n - 1
4     function_values(i+1:n) = ( function_values(i+1:n) - function_values(i:n - 1) )
5     ./ ( given_points(i+1:n) - given_points(1:n - i) );
6 end
7 value = function_values;

1 function [value] = polynomail_eval( args , eval_points , given_points )
2 value = args( length( args ) );
3 for i = length( args ) - 1:-1:1
4     value = value .* ( eval_points - given_points( i ) ) + args( i );
5 end;

1 function [ f_series ] = Newton_eval( given_points , function_values , eval_points )
2 args = newton_coefficient( given_points , function_values );
3 f_series = polynomail_eval( args , eval_points , given_points );
4 % plot( eval_points , f_series );

1 f = @(x)(1 ./ (1 + 25 * (x.^ 2)));
2 plot_points = -1:1e-6:1;
3 yy = feval(f, plot_points);
4 plot(plot_points, yy);
5 hold on
6
7 for n = 4:4:12
8     given_points = -1:1/n:1;
9     function_values = feval(f, given_points);
10    f_series = Newton_eval(given_points, function_values, plot_points);
11    plot(plot_points, f_series);
12    hold on
13 end
14 axis([-1, 1, -1, 1]);
15 legend( 'f(x)', 'n = 4', 'n = 8', 'n = 12', 'Location', 'best');
```

0.2 The result is shown as follows.

Problem 2.

Calculate the integral of x^n with Newton-Cotes Formula.

Proof. **0.3** The code is shown as follows.

```

1 function [ coeff ] = cotes_coefficient( order )
2 %Calculate the cotes coefficient with the order given
3 %Use the equation given at Page179, exercise3
4 n = order
5 matrix = zeros(n, n);
6 for i = 1 : n
7     matrix( i , : ) = (1:n) .^ i;
8 end
9 c = (n .^ (1:n)) ./ (2:n+1);
10 c = transpose(c);
11 coeff = matrix \ c;
12 coeff = [coeff(n); coeff];
13 end

```

```

1 function [ coeff ] = get_coeff( order )
2 % get_coeff of newton_cotes formula of interval
3 % order means the order of the formula
4 switch order
5     case 1
6         coeff = [1, 1];
7     case 2
8         coeff = [1, 4, 1];
9     case 3
10        coeff = [1, 3, 3, 1];
11    case 4
12        coeff = [7, 32, 12, 32, 7];

```

```

13     case 5
14         coeff = [19, 75, 50, 50, 75, 19];
15     case 6
16         coeff = [41, 216, 27, 272, 27, 216, 41];
17     case 7
18         coeff = [751, 3577, 1323, 2989, 2989, 1323, 3577, 751];
19     case 8
20         coeff = [989, 5888, -928, 10496, -4540, 10496, -928, 5888, 989];
21     otherwise
22         error('order should be between 0 and 8 —get_cotes_coeff');
23 end
24     coeff = coeff / sum(coeff);

```

```

1 function [ coeff ] = new_cotes_coefficient( order )
2 %Calculate the cotes coefficient with the order given
3 %Use the equation given at Page179, exercise3
4 n = order;
5 matrix = zeros(n, n);
6 for i = 1 : n
7     matrix( i , : ) = (((1:n) ./ n) .^ i);
8 end
9 c = 1 ./ ( 2: n + 1);
10 c = transpose(c);
11 coeff = matrix \ c;
12 coeff = [coeff(n); coeff];
13 end

```

```

1 function [ result ] = newton_cotes( func, interval, order )
2 %NEWTON_COTES Use Newton-Cotes Formula to Calculate the intergral.
3
4 if nargin < 2
5     error(' Too few inputted arguments, please check if function and inteval for integratin
   — Newton-Cotes ');
6 elseif nargin == 2
7     order = 2;
8 end
9
10 if order < 0 || order > 8
11     error(' Order Error: The order should be between 0 and 8. —Newton-Cotes ');
12 end
13
14 low = interval( 1 );
15 high = interval( 2 );
16
17 if order == 0
18     result = feval(func, (low + high) / 2) * (high - low);
19 else
20     coeff = get_coeff(order);
21     eval_points = low : (high - low) / order : high;
22     eval_points = transpose( eval_points );
23     result = sum( coeff * feval(func, eval_points)) * (high - low);
24 end

```

```

1 function func = get_func( n )
2     func = @(x)(x .^ n);

```

Table 1: Integral of x^n using Newton-Cotes Formula

```

1 % Homework1.3.1
2 interval = [0, 1];
3 result_matrix = zeros(7, 6);
4 for n = 1:7
5     func = get_func(n);
6     result_matrix(n, 1) = integral(func, 0, 1);
7     for order = 0:4
8         func = get_func(n);
9         result_matrix(n, order + 2) = newton_cotes(func, interval, order);
10    end
11 end
12 disp(result_matrix)

```

0.4 The result is shown as the table above.
